Hotbasic Debugger is a Windows application that works together with the Hotbasic programming language. Hotbasic is an interpreted programming language. It can run on Windows, Mac and Linux. Hotbasic can be compiled with Sun's Hotbasic compiler, and it can be linked to most commercial compilers and to some debuggers. Hotbasic's debugger does not require files to be in a specific folder, instead it will open and evaluate the source file when the debugger is launched. What can be seen in the the current screen shot are the source code of the Hello World application, the debugger and source browser view, the variable window, the function view, and the library and include window. The code (Hello World application) consists of 4 source files: Hello.l Hello.l Main.l Input.l The debugger window consists of a tabbed interface for navigating through the 4 source files. The function window is like a sub window for every function in the application. It displays the local variable in the function scope. The variables window is the general window for viewing the local and global variables of the application. The library window is for viewing the libraries included in the project. The include window will include a reference to the source of the library. In that case, it may be time to do some testing, and find a better language. Consider that our.NET/C# debugger, the one that gets installed with VS.NET will not display function breakpoints. This is for several reasons, and not a bug. You could easily work around that
