Explanation of the application features Result. In the result window you will see the results of the calculations and the final result will be computed as a curve. The results are stored in an.html file. You can save the results or print them. Settings. You can modify the parameters, such as the maximum and minimum values of the inductance and the number of periods to be calculated. The minimum step can be considered the precision of the result. Inductance. You can select the type of toroid to be calculated and the number of periods. Ferrite includes fifteen types of toroids for your convenience. Minimum. You can set the minimum value of the magnetic field $H(s)$ to be evaluated and, therefore, the minimum value of the ferrite coefficient, K_s . The maximum value of the magnetic field is determined by the maximum external magnetic field

applied to the toroid. Maximum. The maximum external magnetic field $H(s)$ is determined by the maximum input value of the variable H in meters. Applying a magnetic field. You can start the application and select the number of periods in a specified voltage range. On the screen below, the minimum and maximum values are shown in meters and Ks is in oersteds. Input. The output of the application is a step by step procedure and includes the following elements. Min. This element is the minimum value of the toroid. There is no effect on the result of the calculations but the index to the curve is modified. Max. This element is the maximum value of the toroid. This value is considered the value of the index in the curve. Calculation. You have to input the number of periods in volts for the selected voltage range. Start/Stop. This element is used for starting or stopping the procedure of the calculation. Index in curve. This element is used to calculate the output of the application. It is the index of the

final results. Output. You can choose between an html file with the results of the application or the output data.

Ferrite Application To run the application, you must select your preferred operating mode. The different modes are described in the following table. Mode Output Format Applications HTML FILE FerriteXML Results html html HTML FILE The first mode is the application. You can
