#### Visual Studio Shell Redistributable [Win/Mac]

The Visual Studio Shell Redistributable package is the most suitable distribution platform for Visual Studio developers and as such, Microsoft is offering installation files for Visual Studio 2008, 2010, and .NET 4.5 and above. That allows you to upload applications made with Visual Studio to the web to get the necessary functionality and design elements for the final product.

Due to the complexity involved in developing a fully working program, the .NET 4.5 and above version comes with a lot of features and improvements that are made to make your development process easier. In fact, .NET 4.5 is the standard for producing applications that aim to be distributed on the web. All packages are available for free to anyone. Installers can be easily downloaded at [www.microsoft.com/visualstudio/downloads](http://www.microsoft.com/visualstudio/downloads). Visual Studio Shell Redistributable Packages may work with any setup program you're using to deploy your application. That means that if you're using an MSI, EXE, or another installation type of your choice, you will be able to use our package even if you're not using a Microsoft setup program. What does this mean? The Visual Studio Shell Redistributable Packages are compatible with any version of Visual Studio, including Professional, Standard and Community edition, and you can use the packages with the upgrade of Visual Studio. Installations will not be limited to only Visual Studio installation folders and you will also have the ability to perform updates and maintenance to your application in the future, as the VS Shell Redistributable Package will be exactly the same as the one included in Visual Studio itself. The VS Shell Redistributable Package includes a set of configuration options that allow you to turn off several features in Visual Studio or in the application that will be installed in the end. The exact set of configuration options may vary depending on your needs and how you want to use Visual Studio. It's your choice to choose which ones you would like to enable or disable as well as the ones that will be included in your final project. Vastly different from the Visual Studio 2010 Shell Redistributable Package, the Visual Studio Shell Redistributable Package for .NET Framework 4.5 and above include a set of options that allow you to install Visual Studio Tools (e.g. Immediate Window) in addition to setting up the Project configuration, various design and font related settings, Visual Studio Text editor integration and others. A: You need to link with the Microsoft library which provides the two classes you need to use. In the visual studio command prompt, type "Reg:Root\Microsoft.NET\Framework\v4.0.30319" to locate the reg file which is the key to find the Microsoft library. You can find that by typing reg query "Software\Microsoft\NET Framework Setup\NDP\v4\Client" If you look in one of the keys returned, you will see a key called Current Version. In that key you will see a string called Unique Major Version. The value for the Unique Major Version will be the same as you have in your C# project file. Then from the Reg: Root\Microsoft.NET\Framework\v4.0.30319\Framework Setup\NDP\v4\Client.exe you will be able to see in the manifest where the msdtxxxxxx files are stored. Just type "msdtx" and you will see all the msdtx files. You can find your dll by typing one of them, and you will get the dll info. You will see that the dll info has a path which points to the local bin file (Build\Native\xxx.dll). In your project file you will find there is a dll reference to this dll. Then simply add a line like this to your class: [DllImport("msdtx.dll"),
