MemoCactus Crack

The size of a note is determined by the MemoCactus.dll, set through the MemoCactusOptions.xml file. If you have a display with a large horizontal resolution (X), choose a high size. Otherwise, you will have to decrease the size, if your display is smaller. Notes are not visible by default, to avoid annoying distraction. You can activate them in the menu or via Ctrl+N. Notes can be hidden by clicking on the note itself with the mouse or on the Notes window header with the keyboard F3. Notes are not saved in the registry, to avoid confusion and memory problems. Notes are stored in a file in the temp directory, in the same format as a.txt file. Notes can be exported in the XML format. Notes are synchronized with a cache file. Notes are automatically cleared after a period of time. Notes can be reviewed via Ctrl+P. Notes can be cleared from the cache file by clicking on "Clear Cache" in the menu. MemoCactus can be used like a regular notepad program (similar to Notepad) but note that, due to its floating nature, MemoCactus doesn't need to have a window open on your display to show the notes. The size of MemoCactus can be set by changing the MemoCactusOptions.xml file. MemoCactus can read from text files (configuration stored in the cache). Note that MemoCactus is an easy tool to use, but it may be useful to show some tips to improve it, if you feel its too simple. Some tutorials can be found on our website: Here are some more help/tutorials in english: Description: MemoCactus works well with Windows NT, 2000, XP, Vista and Windows 7. The.NET framework is not needed for MemoCactus, but is strongly recommended. Thanks to the community on file bugs and contribute to improve MemoCactus. MemoCactus can help you

What's New in the MemoCactus?

MemoCactus is a simple tool which helps you make notes of events, dates, appointments, etc. Rather than being look like a virtual sticky note, the note created by MemoCactus is just a text that "floats" on the screen itself, superimposed on top of all

the other stuff showing on your display. This means that, like the trusty PostIt hanging on the side of your monitor, you'll be able to see your note at all times. For each note you can define font, color (solid or gradient fill), date to appear and "see also" that can refer to file name or internet hyperlink or may be just a comment to the note. With MemoCactus, adding new note is quite simple and fast, almost as fast as the velocity of thought. Notes can be placed at any location on the screen at will, in group or each note separately. Options: You can use MemoCactus in safe mode, in which the notes are not saved on the local disk, or in the normal mode, in which the notes are saved locally. When MemoCactus is opened, you'll be asked about safe mode, whether you want to use this mode. You can change the setting of the notes (for example when a note is to be deleted, the settings are stored by MemoCactus) at the preferences tab. You can use MemoCactus without any interface and without java or jre. You can use MemoCactus as a special kind of annotation software, using labels, windows and buttons. You can use other notes editor as WebDAV using an url (that can be set from preferences). You can use MemoCactus in floating mode, it will show you notes like PostIt notes but floating on the screen. You can use MemoCactus without changing your system configuration. Notes: You can use MemoCactus without changing your system configuration. MemoCactus is free software, distributed under GNU General Public License, version 2. MemoCactus can be used and distributed freely, for both private and commercial use. You can find the official web site in Memocactus.org
