I am using the following html and css for text for to give feedback to the user: Status: The above code displays "Status: " in red. Is it possible to control this text as the "Status: " content could change (e.g. a variable value) and I want to be able to control this text? A: No, you have to just use red text inside a span. You cannot control the content of the span. You might use inline-block if you want the text to behave like normal text. Asynchronous transfer mode (ATM) is a high-speed network technology that is being used to provide user data networks. In a typical installation of ATM technology, a plurality of network nodes are connected via communication links to allow for the transmission of fixed-length ATM cells from one node to another, each cell comprising a header and a predefined number of information bits known as the payload. The header of each ATM cell includes a five-bit generic cell header and a twenty-three-bit virtual path identifier (VPI) and virtual channel identifier (VCI) field that respectively indicate a particular path through the network and a particular virtual channel connection through that path. At each network node, the header of an ATM cell is parsed to determine the location of information bits that correspond to a particular application or subscriber using the network. Since the network is free to use one of a plurality of different paths through the network to connect each pair of network nodes, the header of the ATM cell provides information as to which path is to be used to send the ATM cell. This path may be selected using a routing protocol, such as any of the Internet protocol (IP) routing protocols, such as Open Shortest Path
