The present invention relates to a method for producing a sintered body or a powder compact, and more particularly, to a method for producing a cubic sintered body or cubic powder compact by using powder material containing one or more of Fe, Cr, Co, Ni, Cu, Zn, Pb, V, Nb, Mo, W and/or other metal elements. Metal has heretofore been used in various fields, and particularly, since 1930, a phenomenon in which physical property of a solid changes between a high temperature state and a low temperature state has been extensively studied. It has been reported that by volume contraction of a sintered body or a product of compressing metal powder, a specific phenomenon called martensite transformation occurs in which a crystal structure of a metal is transformed into an amorphous structure, and a crystal structure is changed to an amorphous structure. For instance, R. E. L. Peierls and H. Thomas polemically argued that when a metal is cooled to a low temperature, the metal changes its crystal structure and its physical property varies
