Q: Trying to understand some logic in this recursive C program. So I was trying to learn recursion by trying to write a recursive program. The code below draws a binary tree of infinite depth. I understand most of it apart from the line `A * A * NULL * B / 4`. What I don't understand is why they can choose a node on the left side of the table, the node on the right side, or the node in the middle. Maybe I'm missing something, but it seems like all I can choose is a node in the center, and that's not what's happening.

```
#include <stdio.h>
#define max (long int)
-2e308
int main() { //returns 0 if tree is balanced
int r; r = trim(1024,3,1,2,0); //recursive function
void trim(int n) { if(n >= max) return; if(n & 1) { printf("%d", n); trim(n * 2); } else { printf("%d", n/2); trim(n); } } return 0; }
A: n/2 only works well for integers; on other numbers like "1.23" "2.34" it actually results in "0.23" "0.46". But for "1.23" "3.45", if n is divisible by 2, it is 2, so n/2 is 1, which means you divide by 1, which
```
