Q: Can GitHub Pages generate and serve dynamic pages? I'm working with a client that has a large (a couple thousand pages) website. It's all static files, but I've converted a bunch of them to Jekyll/Liquid/Ruby to more easily make some dynamic elements. Since we've also been using GitHub Pages, it seems like the perfect solution to serve these pages. I was wondering if GitHub Pages can generate pages that are dynamically generated, in a way similar to Jekyll's liquid templates. These would be divs that are updated when certain conditions are met (like in Jekyll pages) but they would be generated with Ruby code, and served out as static content. Any ideas?

A: GitHub Pages have a built in templating engine. From the github pages docs: By default, GitHub Pages uses a JavaScript templating language called EJS. you can use a site like adzerk.com to mock up your page and see how it works. for your needs you'd need a web server that's running nodejs. I personally recommend nodejitsu.com

Q: In Ruby, can I convert a string to a timespan without using a method in the Kernel like Time::Span? I have the following in a Ruby file: `x = Time.parse('20 min ago').to_time` The output is `x: #>` The output I am looking for is `x: 20 min ago` (which is an actual timespan of 20 minutes in the past). I was thinking about trying to get a gsub of a string which goes in for the d: day, h: hour, and m: minute, which takes a string and returns a string of that value, but can't find a way to get this into a method without having it be a part of the Kernel. Is this something that I could do using a method in the Kernel?

Is this something that I could do using a method in the Kernel? It's really easy if you add `to_i` to your String. Example: `'20 min ago'.to_i => 20` If you really want to do something like this, if you could give us an example of what you've tried that you've got so far, we'd love to see what you've got. EDIT If you really just want to find a method to take a string and turn it into a Time. You can go through the routes such as the Kernel.method or the String method, but I think the most "Rubyish" way would be: `module Kernel def initialize @methods = Hash.new { |h,k| h[k]`
