A Bayesian approach to account for intraclass correlation in the analysis of G-P-O models. A Bayesian approach for fitting a generalized Probit (G-P-O) model to data that are not necessarily from a true G-P-O model is introduced. A Bayesian perspective may be used to examine the data in terms of randomness of the residuals, etc., instead of considering the parameters of the model. A special case for the one-parameter logistic model, the Bernoulli model, is considered as a convenient link to a single-parameter G-P-O model. It is shown that by specifying appropriate priors, the posterior distributions are a mixture of normals. In particular, the models are identified as such. An analysis of the G-P-O models in terms of first-order stochastic dominance is also carried out for the Bayesian framework.
