Screenshots provided by otakugames.com What Is "a Long Time"? Relying on a popular definition of the term "a long time," we can easily come to the conclusion that no one in your family has a long-term illness, that you've dealt with a long-term illness for several months, and that you would have to have lived in a cave for a long time (and/or be a clone of Stephen Hawking) before you thought something was "a long time." A longer time period means that the condition or problem lasts longer, or that the treatment is longer lasting. Examples: A long time would be when you live in a cave for many days or weeks. These days, a longer time period is when a little insect might have three months to live. Recent examples of longer times would be several years for you to live, the period a person might have to live with a brain tumor, the time a person is waiting for a transplant, and the length of time an anthrax bioweapon might be stored in a soil sample. How Long Is "a Long Time"? Traditionally, when a person has had a long-term condition or problem, they have been sick. The earliest recorded understanding of the medical term "a long time" is in 1551: A long time is well known to everyone, and a long time is the fifth part of the world; for from the beginning to the end of the world was a long time; it is now growing less and less. This is a long time, and it is not yet come. This leads to the problem of how to best measure a time period. Sick and Healthy People In the 1551 quotation, the term "long time" seemed to describe the time from the beginning of the world to that time. What people then meant by this term was the time from the beginning of human history to the present. In the modern medical setting, this is a time period on the order of tens of

The diagnosis of active tuberculosis is based on the detection of *Mycobacterium tuberculosis* and definite evidence that tuberculosis is active. Therefore, it must involve clinical evaluation, laboratory investigation and bacteriological examination. Although clinical diagnosis is of the utmost importance, the TB diagnosis strategy might include additional tests or tools for TB confirmation, so that we can eliminate TB cases if needed. Differentiating *Mycobacterium tuberculosis* (MTB) from nontuberculous mycobacteria (NTM) is important but difficult. At the same time, differentiation of *M. tuberculosis* complex from non-tuberculosis *Mycobacteria* (NTM) is useful for initiating anti-mycobacterial therapy. Some of *M. tuberculosis* complex show resistance to tuberculostatic drugs and *M. tuberculosis* complex/NTM differentiation is important for antituberculous therapy. In contrast, in the recent years, the importance of nucleic acid amplification (NAAT) tests has been increased because the use of nucleic acid amplification (NAAT) tests is more efficient and results are available in a shorter time than culture. In particular, the real-time PCR technique has been increasingly used in the field of tuberculosis diagnosis, although NAAT tests are not yet completely reliable and are not suitable for all clinical situations for TB diagnostics.
